

Shinkiko Class The release of a new type of High Genki apparatus

We have completed the development of a new main unit of High Genki apparatus, the HG-1003 (High Genki 3), and will release it in the middle of October. In this month's issue, I will talk about its function in detail.

The new High Genki has a smaller main unit

The main unit of the new High Genki apparatus 3 has been downsized from a small attaché-case size to an A5 size. It is small, weighs only 1.1kg, light enough to carry around with one hand, and can be put on a bookshelf when not in use. The stainless box has a lid that opens widely like a notebook computer.

Two "Power Sheets" that have 10,000 triple logos all together

When you open the lid, you will find a transparent plastic plate. Inside it, there are two plates designed for the High Genki apparatus with 5,000 of the SAS triple logo engraved on each of them. This plate has been sold as a large-sized Shinkiko Plate; it has been cut into half and 5,000 of the triple logo have been engraved on them, and two of it are used in this new High Genki.

Moreover, what is special about this plate is that, in addition to 10,000 of the triple logo in total, each logo has a pyramid mark engraved on the letters of Shinkiko.

When we ship this product to you, your name or your company name will be engraved on the plate. Also, the serial numbers of each heads that will be connected to the main unit will be engraved on it.

Up to four various heads can be connected

At the front of the main unit, there are four output terminals for connecting various heads. At the right side there is a power supply terminal where you connect an AC adapter. By connecting the adapter, power will be applied; when it is connected, the power supply indicator light at the front glows red.

All types of head that have been released so far can be connected; up to four heads can be connected at a time.

Sending the energy remotely by putting photos

With the use of the strong plates designed for the new High Genki apparatus 3, and with the lid that opens widely, you can put or clip photos on the plates and remotely send Shinkiko energy much easier.

Features of the new High Genki apparatus

The new High Genki apparatus 3 catches Shinkiko energy from the universe as much as possible, and properly transfers it to its owner, his or her family or close friends, including the heads. To realize that, I completely got rid of all the fluff; newly designed a plate for the apparatus; and decided to engrave on to the plate the name of an owner and the serial numbers of the heads that will be used. So, please note that, in order to engrave your name and etc., it will take from two days to one week for you to receive the new apparatus after your purchase.

Also improves old High Genki apparatuses

Conventional High Genki apparatuses accept various high-powered heads including radiating heads with a Power Unit or the White Ceramic Head by using a power sheet with 1,000 of the SAS triple logo engraved on it. The new plate designed for the new High Genki, which is used in the new High Genki apparatus 3, works ten times more powerful than the power sheet. The Shinkiko energy from the universe has gradually become powerful along with the shipments of high-powered heads so far. I am sure the energy will become drastically more powerful as the new High Genki apparatus becomes popular among many people. The stronger the Shinkiko energy becomes, the more powerful the ki goods including the High Genki apparatus will become. These days, there are so many seemingly negative events happening around us, which are caused by the earth's purifying itself. In order to cope with them, I would like many people to understand the meaning of releasing this new High Genki apparatus in this anniversary year which marks the 25th year since Shinkiko therapy started.

A power sheet newly designed for a High Genki Mini

I have newly designed two types of power sheet. One is a power sheet that has 1,820 of the SAS triple logo engraved on both sides, and is supposed to be inserted inside the main unit of the High Genki Mini.

And the other is a power sheet and is also a nameplate with a model number of the High Genki Mini engraved on it. At the back of this sheet, there are 500 of the SAS triple logo engraved on it. So, with the three power sheets mentioned earlier, there will be 6,000 of the SAS triple logo. On the front of this nameplate sheet, I will engrave not just its model number but its serial number, an owner's name and the name of one head which will be connected. With these, it will be possible to gather Shinkiko energy from the universe and steadily send it to the owner and the registered head without fail.

By engraving the name of registered heads, the heads will firmly be associated with the main unit of a High Genki Mini. If you buy a Mini Stick Head which could not be connected nor registered, together with a High Genki Mini, the combination of the two will fully fulfill its function as a ki transferrer.

The structure of the High Genki Mini looks like these two types of power sheet have been sandwiched between transparent resins. The color of the case and the power sheets inside are unified in silver and the nameplate can be seen through a transparent resin; the High Genki apparatus 3 is also designed in the same way.

This High Genki Mini will be available in two types: the type A is equipped with a switch that allows users to choose between AC power and rechargeable battery power; and the type B is used only with 100V AC power supply (without charging function).

Please note that this High Genki Mini is for personal use. It is only the owner of the device, who can register as a full member of the SAS Association, and also who can enjoy privileges such as monthly magazine subscription service, free use of centers around the country, and many other things.

More accessories for the Mini Stick Head

The Mini Stick Head whose electric powered vibrating part has been left out, is the smallest and lightest head, although it is comparatively high-powered. In order to take advantage of its features, many users must have dangled it from their necks like a pendant. But it works better when it directly touches the body and lets the user focus on it. To let the high powered Stick Head gather ki more powerfully, I made a holder which allows users to apply it to their body easier. This holder, Mini Stick Head (MN) Holder, will be released to enhance the function of the Mini Stick Head as the handiest head, together with the release of the High Genki Mini.

This holder allows you to fix the Mini Stick Head to the Handle Set for Stick Head, which has already been released separately, in order to attach the head to the set. This plastic holder fixes the Mini Stick Head without harming it and allows you to attach the head to a handle with ease.

The Stick Head is type B

Lower cost and higher power have been realized

The conventional Stick Head weighed about 70 grams and was made of titanium material that is light and corrosive-resistant. But it has been proved that, by changing the material of a powerful ki good, the Shinkiko Plate, from titanium to stainless material, that the quality of the material does not matter anymore since Shinkiko energy from the universe has become stronger. By using stainless material instead of titanium, the material cost was reduced, and it became possible to sell ki goods at lower prices. In the same way, I tried to keep the price of the Stick Head as low as possible: I reduced its length from 96 mm to 88 mm; managed to keep its weight down to about 120 grams, 50 grams heavier than before; and developed a Stick Head made of stainless.

An easy- to-massage structure

The traditional Stick Heads had tightly packed pyramids at the tip of it; so a cap which was sold separately had to be used to cover the tip when used for massage. A new Stick Head type B has a dome-shaped tip covered with a cap from the start, and there are ki transferring elements, made up of pyramids and ceramic, built inside the tip.

Three grades of the Stick Head type B

Also, it has been proved by the release of the White Ceramic Head that the use of a special ceramic material will make a powerful head, although the cost becomes a little expensive.

In order to fuse this feature of the White Ceramic Head with the Stick Head, I set up three grades, B1, B2 and B3, in developing a new Stick Head type B. The bigger the number, the more ceramic material is used. The most affordable B1 has ten times more ki transferring elements than a standard radiating head does, and the entire body is made of stainless material which made it cheaper. In the B2, 100 times more

transferring elements are used, and by using a ceramic ring in a part of its body, it has been made into a more high-powered head than a standard head with a 100 times more power, with the help of synergistic effect of the ceramic material. All the tip section of the high-end B3 is made of ceramic material, and it has ki transferring elements which are the same as the one used in the White Ceramic Head. It is difficult to measure exactly how much power the ceramic material increases, but I think that an amount of ki it can transfer must be almost as much as the White Ceramic Head can.

An easy-to-upgrade structure

It should be easier to have your heads upgraded whenever you feel you want to receive more ki. As for the traditional Stick Head, we were offering upgrading service that upgraded your head to a 50 times more powerful one or to a 500 times more powerful one. This upgrading needed processing at a factory and it took time to give the head back to users, which was a little inconvenient for them. But with the new Stick Head, in order to upgrade it, you only have to change the part where transferring elements are enclosed; this allows you to upgrade to a better one within a short time.

A separately sold handle allows you to apply with ease

A good thing about this Stick Head is that it is small and portable. But when you apply it to your body or to someone, it is a little difficult to hold. So we decided to release a handle for this Stick Head which will be sold separately. This handle can be attached to the Stick Head by using a screw at the part where a cap is attached: anyone can attach it with ease. It can be used not only for B type but for all the traditional Stick Heads. Also, you can still connect the head with a power cord after you attached the handle; you can hold the handle and apply the head to yourself while making the tip of the head to vibrate.
